IMPLEMENT CLIENT SCRIPT & UI POLICY

ServiceNow – Incident Module

Aim

To implement a Client Script and a UI Policy on the Incident form in ServiceNow. The Client Script validates the Short Description, while the UI Policy controls the visibility and mandatory state of the Description field.

Software / Requirements

1	ServiceNow instance
2	Incident table (incident)
3	Administrator or suitable configuration access
4	Web browser

Part 1 – Create Client Script

1. Open the ServiceNow instance.
2. Go to All → System Definition → Client Scripts.
3. Click New.
4. Set Table = Incident [incident].
5. Enter a suitable Name, for example: Validate Short Description.
6. Set UI Type = All.
7. Set Type = onSubmit.
8. Enable Active.
9. Enter the following script and click Submit.

Client Script Code

```
function onSubmit() {
    var shortDesc = g_form.getValue('short_description');

    if (shortDesc.trim() == '') {
        g_form.addErrorMessage('Short Description is required.');
        g_form.setFocus('short_description');
        return false;
    }

    if (shortDesc.length < 10) {
        g_form.addErrorMessage(
            'Short Description must contain at least 10 characters.'
        );
        g_form.setFocus('short_description');
        return false;
    }

    return true;
}
```

Explanation

The onSubmit Client Script runs when the Incident form is submitted. It checks the Short Description field. If it is empty or contains fewer than 10 characters, the record is not submitted and an error message is displayed. If the value is valid, the form is submitted normally.

Part 2 – Create UI Policy

1. Go to All → System UI → UI Policies.
2. Click New.
3. Set Table = Incident [incident].
4. Enter Short Description is empty in the condition, or use the condition builder to select Short description → is empty.
5. Set a suitable Short description such as: Make Description Mandatory.
6. Enable Active.
7. Save the UI Policy.
8. Open the UI Policy Actions related list and click New.
9. Set Field Name = Description.
10. Set Mandatory = True.
11. Optionally set Visible = True.
12. Save the UI Policy Action.
13. Open an Incident form and test the policy.

UI Policy Configuration

Property	Value
Table	Incident [incident]
Condition	Short description is empty
Active	True
UI Policy Action Field	Description
Mandatory	True
Visible	True

Testing / Expected Result

Test Case	Input	Expected Result
1	Short Description is empty	Client Script prevents submission and displays an error.
2	Short Description has fewer than 10 characters	Client Script prevents submission and displays an error.
3	Valid Short Description	Incident can be submitted.
4	Short Description is empty on form	UI Policy makes Description mandatory.
5	Short Description is filled	UI Policy condition becomes false and the Description field is no longer mandatory

Result

Thus, a Client Script and UI Policy were successfully implemented on the ServiceNow Incident form. The Client Script validates the Short Description before submission, and the UI Policy dynamically controls the Description field.
